

ACM Mobile Client

Bring the power of AUTOSOL Communication Manager (ACM) into the palm of your hand, wherever you are.

Secure Communications

The ACM Mobile Client app communicates securely using encryption to the server, keeping sensitive data safe. When combined with ACM security, user actions that require authorization are enforced, just like the ACM Desktop Client application.

Powerful Administration Tools

The ACM Mobile Server Configuration tool lets administrators fine tune options such as Mobile Client app inactivity timeouts, manage the listing of authorized mobile devices, and choose which device configuration properties are visible. Additionally, the administrator can choose what ACM reports (including customer-created reports specifically for mobile consumption) that ACM Mobile Client app users can access.

Capabilities include:

- Searching for ACM devices present in the configuration.
- Viewing ACM device configuration properties. You control which properties are visible to Mobile Clients.
- Retrieving real-time values from the ACM field device using an alias group of your choice.
- Retrieving the persistent stored values for an ACM device.
- Requesting and monitoring a device command. Commands include: Test Communication, Demand Poll, Request History and Trends.
- Running ACM Reports to view various data for communication statistics, configuration, real-time, EFM history and archive summaries.
